Portfolio overview

I design and maintain documentation for complex enterprise SaaS products, from REST API references and administrator guides to information architecture, release documentation, and content operations. My work combines technical validation, user-focused writing, structured content, and collaboration with Product, Engineering, and QA.

Selected outcomes

- 60% improvement in documentation findability through information architecture and taxonomy improvements (reported resume metric).
- 300+ topics migrated from Confluence to Paligo CCMS with structured, reusable content.
- Long-form to topic-based transformation: reorganized extensive product content into modular, task-oriented documentation.
- Product Owner recognition: received “Pat on the Back” appreciation for restructuring content and improving findability.
- End-to-end ownership: documented multiple QMetry modules, including APIs, integrations, configuration, administration, and release updates.

Case Study 01

From long-form guides to topic-based documentation

Context: Enterprise SaaS documentation had substantial long-form content that made specific tasks and answers harder to locate and maintain.

My contribution

- Reorganized long-form material into focused, task-based and concept/reference topics.
- Improved content hierarchy, navigation labels, taxonomy, linking, and reuse patterns.
- Applied a structured content approach to support clearer user journeys and easier updates.
- Coordinated reviews with the Product Owner and QA to validate technical accuracy and user-facing clarity.

Illustrative before / after content structure

Before: long-form guide	After: modular topic set
“Administration Guide” with lengthy mixed sections	Overview → prerequisites → configure settings → manage permissions → troubleshoot
Repeated setup details across chapters	Reusable prerequisite and configuration topics
Feature descriptions mixed with procedures	Separated concepts, step-by-step tasks, and reference tables

Impact and recognition

The broader information architecture and taxonomy work is associated with a reported 60% improvement in documentation findability. The Product Owner recognized the restructuring and findability improvements with a “Pat on the Back” appreciation.

Skills demonstrated: information architecture • topic-based authoring • content modeling • usability • stakeholder alignment

Case Study 02

Documentation ownership, migration & quality workflows

Enterprise product documentation

Owned end-to-end documentation for multiple QMetry product modules, covering user workflows, administrator guidance, REST API references, developer and integration content, installation/configuration instructions, troubleshooting, and release notes.

Content migration and governance

- Migrated 300+ topics from Confluence to Paligo CCMS.
- Defined and applied topic structure, taxonomy, reusable content patterns, linking conventions, and publishing organization.
- Used Jira to track documentation requests, changes, and review ownership.
- Established structured QA and Product Owner reviews to improve accountability, technical accuracy, and release-aligned delivery.

Representative documentation lifecycle

Stage	Documentation activity
Intake	Use Claude with Slack and Jira connectors to turn actionable Slack discussions into draft Jira documentation tickets; review details before creating or assigning tickets
Discovery	Review feature behavior, API specifications, and product workflows
Draft	Write modular tasks, concepts, and reference material
Validation	Check behavior; coordinate QA and Product Owner review
Release	Publish and verify navigation, links, and release alignment

Skills demonstrated: documentation strategy • CCMS migration • docs-as-code practices • release readiness • cross-functional review

Writing Sample 01

REST API reference — QMetry Test Management

Public documentation example: Adapted from the published QMetry Test Management API for Test Cases reference.
Source: QMetry API for Test Cases.

Get List of Testcases in Folder

Retrieves a list of test cases from a specified folder.

POST /rest/testcases/list

Content-Type: application/json

Request parameters

Parameter	Type	Required	Description
tcFolderID	integer	Yes	ID of the test case folder
showAllStateEntities	boolean	Yes	Set to true to include all state entities
start	integer	No	Starting index for records
limit	integer	No	Maximum records per page
page	integer	No	Page number

Illustrative request body

```
{ "tcFolderID": 42, "showAllStateEntities": true, "start": 0, "limit": 20 }
```

The folder ID and request values above are illustrative; consult the public API reference for your environment.

Response Codes

HTTP code	Meaning
200	Test case list retrieved successfully
400	Invalid JSON object or missing mandatory fields
401	Unauthorized or session expired
500	Server connection timeout

Writing Sample 02

Task-based administrator guide — illustrative sample

Sample type: Original procedural documentation example for the fictional Northstar Workspace product.

Configure a default workspace region

Set the default region for new workspaces so administrators do not need to select it during every provisioning task.

Before you begin

- Sign in with an account that has the Organization Administrator role.
- Confirm the preferred region with your organization’s data residency requirements.

Procedure

1. In the administration console, select Organization settings.
2. Open Workspace defaults.
3. Under Default region, select US or EU.
4. Select Save changes.

Result

New workspaces use the selected default region. Existing workspaces are not moved or modified.

Verify the setting

Open Workspace defaults again and confirm that the saved region is displayed. If the setting does not persist, verify your administrator permissions and retry.

Additional documentation strengths

REST API and OpenAPI/Swagger • Postman validation • Markdown and Git workflows • DITA/XML • Paligo • Confluence • Jira • release notes • integration guides • information architecture • cross-functional review
